

Permission Management for Cloud-Intensive Companies

Entitle simplifies the process of giving and taking away granular and temporary access, reducing the risk of unnecessary access. It eliminates bottlenecks related to manual access granting and enables dynamic, just-in-time authorization for robust least privilege programs.

By automating permissions, security teams get a centralized view of all active permissions and audit trails of every action, allowing for simple user access reviews. Entitle is deployed in minutes and comes out of the box with over 100 integrations including AWS, GCP, Azure, GitHub, Salesforce, MongoDB, and many more.

Popular use cases

Attribute-based lifecycle automation

Example flow: Permissions change automatically for joiners, movers, leavers, on-callers and other scenarios based on attributes from 3rd party systems such as HR management systems and identity providers.

Automate user access reviews for better compliance

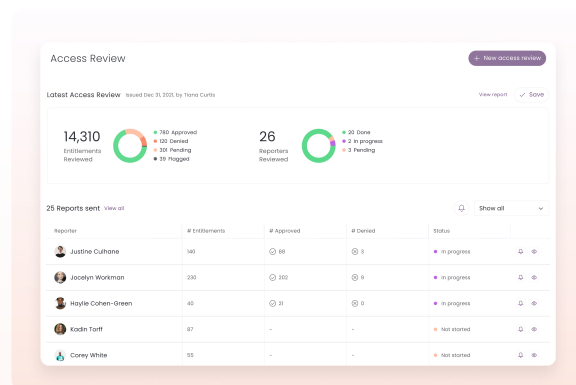

Example flow: Easily create reports for SOC2, SOX, ISO27001, HITRUST, and more with automated evidence collection and by delegating access reviews to context-aware business managers.

Break-glass access to production for on-call engineers

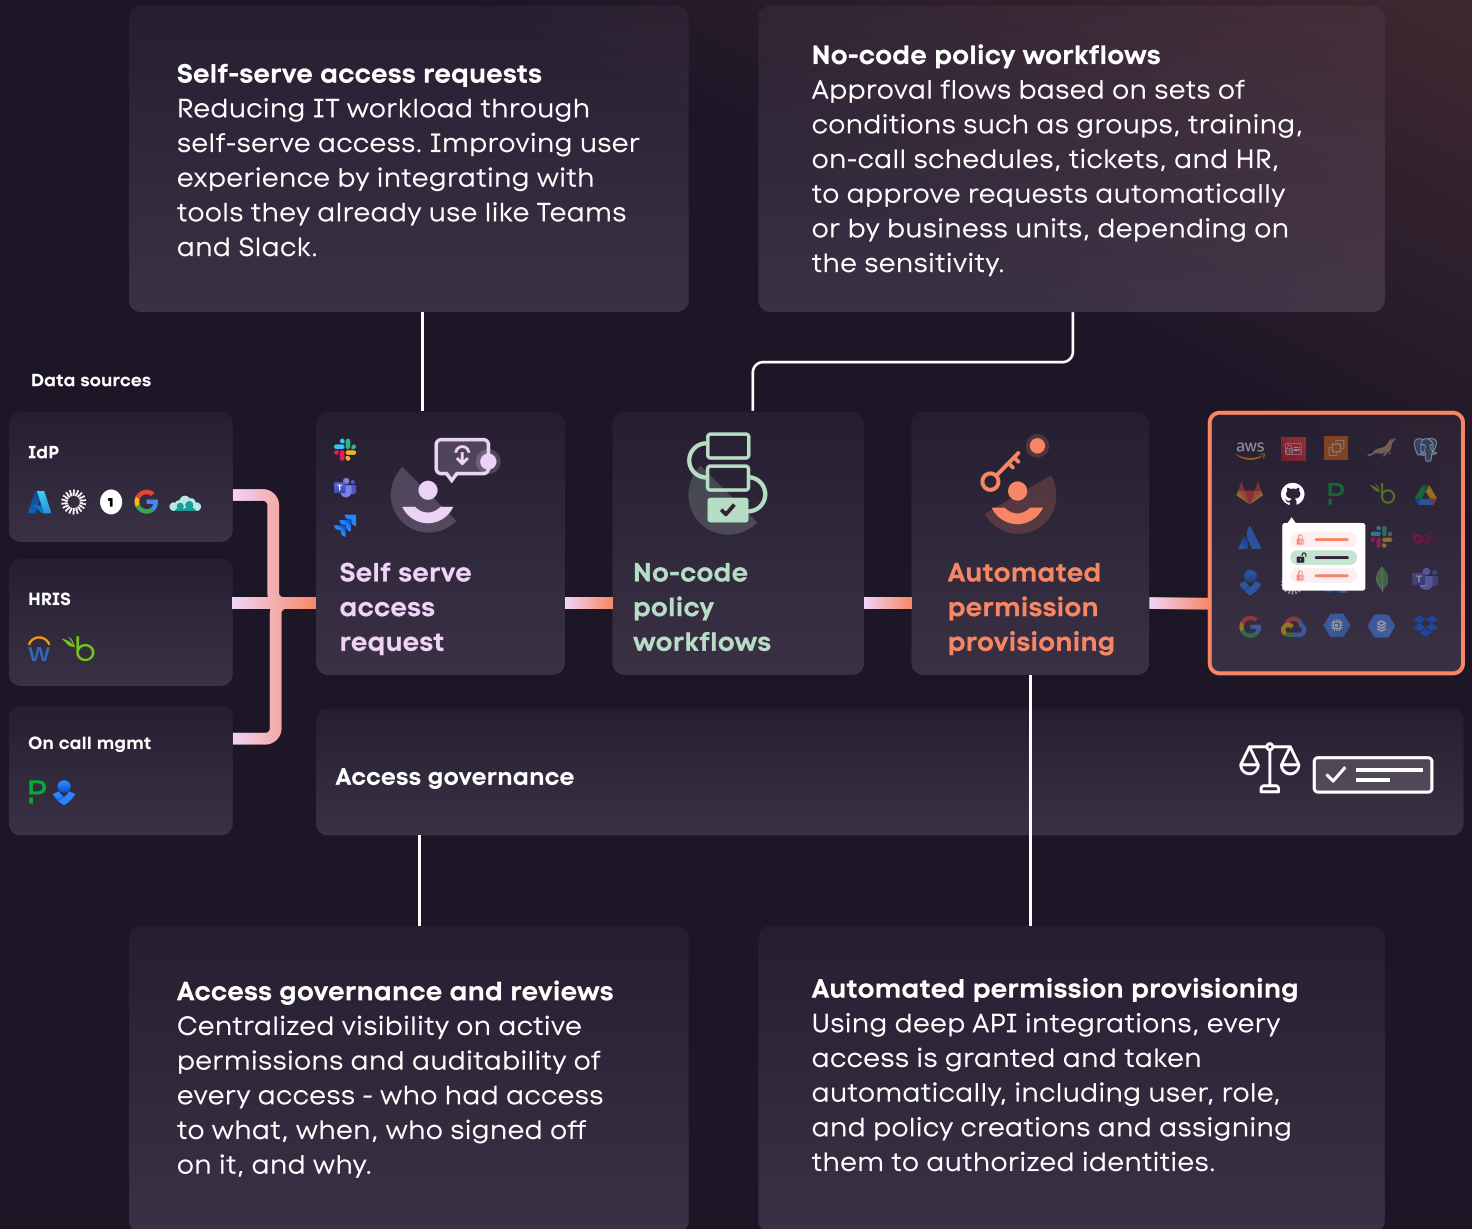

Example flow: R&D members in an on-call schedule can self-serve access to production environments which will be automatically revoked after 3 hours.

Break-glass access to customer data for customer success teams

Example flow: Assignees of open customer support tickets are automatically authorized to access assets containing PII. When the ticket closes, the permissions are revoked.

How it works?

"You don't see many security solutions that improve productivity. Entitle is different."
